

A Guide to the Model 50 KeySafe for Holders & Wearers

Congratulations! If you are reading this, you have either activated a safe as a Model 50 KeySafe, are considering doing so, or have accepted the keys of someone owning a Model 50 KeySafe. By doing so, you have taken a big step towards entering the world of secure on-line chastity. The purpose of this guide is to help you understand how the safe works with the Keysafe site and how it can and cannot be used with the site.

*However, this is not a guide to using all the features on the Keysafe site. For more complete information on getting the most out of the site, please refer to the documents **A Holder's Guide to Managing Keys on Keysafe** and/or **Important Information for Wearers** on the Documentation page of the site.*

This guide is organized as follows. The first section provides some general information about Model 50 safes that should be of interest to both holders and wearers. The second section contains information of particular interest to Wearers and the final section is directed to those who want to use a non-recommended safe.

General Information About the Model 50 KeySafe

Unlike all the other Keysafe Models (100, 200, etc.), the Model 50 is **not** a safe provided by KeySafe. The wearer must purchase an appropriate safe from whatever source he/she prefers and then has to contact the web administrator of the KeySafe site to have her/his profile set up for a Model 50 safe. KeySafe charges a nominal one-time fee to cover set-up costs. Once the profile is set up properly, there are no ongoing fees and all features of the site and the Model 50 are available to the wearer as long as he/she maintains their profile on the site.

The Model 50 concept

The Model 50 was developed to permit wearers and holders to play on the KeySafe site using moderate security safes that require a numerical combination. The KeySafe site will generate a random 8-digit number (called the KeyCode)

that the wearer can use to set the combination of their safe. Once the wearer has had his/her keys accepted by a holder or starts a session with the Strict Twins (Strict Mistress or Strict Master), the combination will **not** be available to the wearer (although the holder can see it at all times) until his holder grants a permission. After a permission has been granted, the wearer can get a new random combination and can start a new chastity session.

All of the fun features of the site work with a Model 50. The holder can set windows or play games with the wearer. If the wearer finds a permission window or wins a game, she will get the combination, otherwise it remains hidden from the wearer.

Both holders and wearers should know that a Model 50 safe is a stand alone safe and is **NOT** connected directly to the web or the site in any way. There is no way for the holder to determine if the safe has actually been locked or if the door is open or shut or if a manual key has been used to open the safe. Ultimately, the holder must trust that the wearer has locked his/her keys in the safe and that the wearer will only use the combinations provided by the site to access the keys in the safe. If they want a higher level of security, the wearer should consider acquiring a Model 200 or above safe.

What type of safes will work as a Model 50?

Many different brands of safe will work as a Model 50. However, any safe you consider **should** have the following features:

- Electronic safe with a numeric keypad - can be battery operated or plug-in
- Accepts 8 digit combinations
- Allows testing the combination before locking the safe
- Have one or more manual keys to permit opening the safe if the combination was input incorrectly (otherwise you won't get the keys out!)

Safes meeting these requirements can be found at office supply stores and in all the usual on-line stores. It is possible to use safes that don't meet these requirements as a Model 50 (check out the discussion at the end of this document). However, in what follows we will assume that your safe has all of the above features.

How to get your safe set up as a Model 50 on the Keysafe site

Once you have acquired an appropriate safe and familiarized yourself with its operation, you should contact the KeySafe site administrator using the Contact link at the bottom of any page on the site. He will then set up your safe as a Model 50 linked to your profile. Holders may want to stop reading here but Wearers should continue on to see how to proceed once your profile is linked.

Model 50 Information for Wearers

After your safe and profile are linked, you are ready to start using your safe with the site. The first task is to test the safe and its interactions with the site.

Testing the Model 50

1. The Manual Test – You should make sure that the manual keys actually work in case you have an emergency (or if your Keyholder disappears and you need to get into the safe!).
2. Testing the link to the KeySafe site – When your profile was linked to a Model 50, it was automatically set to test mode. This mode lets you practice repeatedly using your safe and the site with no risk.
 - Log onto the KeySafe site using the profile you asked to be linked to the safe.
 - Go to the Unlock/Checkin page (an option amongst the links at the bottom of the page).
 - There you will find text looking like the following screen shot (please contact us if you are NOT in test mode at this point).

KeySafe Unlock/Check-In Page

Your next Keysafe code is:

54716920

Program this code into your safe and then lock the safe with your keys inside. Be extremely careful to enter the correct key, double & triple check it. Your ability to unlock your safe the next time is dependent on your programming this code exactly as it is shown above. However be careful not to memorize this new code. It's best not to write it down, instead bring your computer and your safe together so you can program the safe while looking at the computer screen.

Note: Once you depart from this web page, you will not be able to return. So make sure your safe is reprogrammed and locked before navigating away.

Note: your safe is in the test mode. When you are ready to exit from the test mode, [Click here](#). But remember that once you do this, you cannot undo it, and your safe can only be unlocked by a Holder who has accepted your keys or by Strict Mistress.

- You will find an 8-digit KeyCode code that you program into your safe as its new combination. Try it now to make sure you can do it without errors (keep a manual key handy in case you goof up!)
- Now click on the Unlock/Checkin link again. You should see a page looking like the following:

KeySafe Unlock/Check-In Page

This page will help you unlock your KeySafe, if you have a pending unlock.

1. First we will check to see if you have an unlock pending.
2. Great, you do have an unlock pending. The key code to unlock your safe is:

54716920
3. Enter this code into the safe's keypad, and enjoy your brief freedom.
4. When you are ready to relock your safe, by entering the next code, return here, and then click the button below.
5. **Caution: do not click the button below until you are ready to re-lock your safe.**

- Notice that the combination given is the same as in the first screen capture. Make sure you can unlock your safe using this combination and then press the Get the Next Code ... button to get your next combination to program into your safe.
- As long as you are in test mode, you can come back to the Unlock/Checkin page as often as you want to test the safe (you can ignore any text about not being able to return to the page). You can never be “stuck” as long as you are in test mode.
- Once you are fully comfortable with how the KeySafe and the KeyCodes function, you are ready to offer your key to Strict Mistress/Strict Master or a Keyholder on the KeySafe site. **After your key is accepted, you should get the next KeyCode, program it into your safe and then exit test mode by clicking on the link at the bottom of the page giving the next Keycode as shown in the**

example at the bottom of page 3. Once your key is accepted and you are out of test mode, you cannot get a new combination from the site to put into your safe until your holder or one of the Strict Twins gives a permission.

Using the KeySafe Model 50 with Strict Mistress/Strict Master

The KeySafe site provides an excellent way for you to keep securely locked whenever you want to enjoy some self-locking or if you are between Keyholders. However, the Strict Twins (Mistress and Master) have their own expectations for their wearers and you should know these if you want an enjoyable experience with either of them.

1. First thing you should know is that the Twins are very willing to share your chastity if you have a KeySafe. They will understand if you have offered your keys to holders on KeySafe before you have either of them hold your keys. Thus, if you have an offer outstanding to Mistress X and you ask Strict Mistress to hold your keys for any length of time AND if Mistress X accepts your keys while Strict Mistress is still holding them, she will gladly transfer control to Mistress X without any delay. This means you will NOT get released before Mistress X becomes your Keyholder.

However, once you have a Keysafe, neither of the Strict Twins are very understanding if you want to start a relationship with a *new* keyholder. Once they accept your keys, they will **not** permit you to offer your keys to anyone else. Therefore, you should make sure to make all the offers you want before signing on with either of the Twins. The **only** time they will relent is when you have an unlock pending but have not yet used it. That permits you to transfer control of your keys to someone new without having to see your combination and can thus stay locked.

2. Second, both of the Strict Twins really enjoy keeping you in chastity, so after they grant you an unlock, **unless you explicitly tell them you have stopped playing, they will automatically re-lock you for the same duration as your last lockup.** In your haste to unlock, you might click on the unlock link near the bottom of the Strict Mistress/Master page when you are granted a permission. This link will take you to the Unlock/Checkin page where you will be given the current unlock

KeyCode. However, if you check your status, you will see you are still locked up by one of the Strict Twins for the same duration as last time.

To avoid this (unless you want it), once you see that Strict Mistress/Master has granted you a release, use the pull down list near the middle of the page to tell him/her you are finished playing and after registering that, THEN go to the Unlock/Checkin page to get the release KeyCode. Now you can update your offers if you want and then go back to either of the Twins and ask them to hold your keys. They are always glad to oblige.

3. Third, remember that the KeySafe site is about making real, high-security chastity possible and both Strict Mistress and Strict Master reflect that philosophy. This means that once you turn over control of your KeySafe to either of the Twins, they really have control. You will **not** get the release KeyCode until they are good and ready to give it to you. While it is true that you know the maximum time they will keep control, no amount of whining if you change your mind can make them give it back.
4. Therefore, we recommend that when playing with Strict Mistress or Strict Master that you have at least one of the manual keys somewhere you can get at it in an emergency, because unlike a flesh and blood Keyholder, there is no way to convince the Twins of your emergency and indeed no way to re-negotiate with either of them.

Playing with Strict Mistress/Master with a KeySafe is not at all like playing with them when you don't have a safe. If the keys to the chastity are in the KeySafe, you really are under their control and won't get out just because you change your mind. So we recommend starting with short durations (maybe even less than an hour to check out your reaction to being truly controlled) and then building up. We think you will find submitting to the Strict Twins more satisfying this way.

Using the KeySafe Model 50 with a Keyholder on the KeySafe Site

The procedures and screens you seen when using your Model 50 KeySafe with a holder are the same as those in test mode with the single (but important exception) that you will not see the current KeyCode combination until you have been granted a permission. Instead you will see the following message...

KeySafe Unlock/Check-In Page

This page will help you unlock your KeySafe, if you have a pending unlock.

1. First we will check to see if you have an unlock pending.
2. Unfortunately there is no unlock pending for you at this time.

You will also find that when your Keyholder has granted a permission to unlock, that the Unlock/Checkin page will show the current KeyCode combination until you press the button to get a new KeyCode. In other words, you won't be "re-locked" by your Keyholder until you get a new combination to put into your safe. Once that happens, you will once again see the message above when you visit the Unlock/Checkin page.

There are a few things to consider when establishing a new keyholding relationship on the KeySafe site. Many chastity wearers have a fantasy of finding a person on the KeySafe site who will hold their key and control them. Without a KeySafe, if truth be told, the keyholding relationship is usually just that, a fantasy, since it is so hard to verify that someone is really locked and that the keys are hidden away. However, with a KeySafe, fantasy can turn into reality very easily (after all that's what the site was designed to do).

Both the chastity wearer and the Keyholder should be clear that they have the same vision of reality when using a KeySafe or problems can occur. On the other hand, if the wearer and the Keyholder are in synch, using the KeySafe with the site can give both of them a chastity experience they can't get any other way. This section offers some hints and suggestions as to how both parties can get the most out of the KeySafe.

1. The first thing you as a wearer must realize is that once your KeySafe is locked and a Keyholder controls the code, you are not getting into the safe unless she/he gives you the code or you use the manual key. If you have

locked the manual keys into the safe (for more “reality”) or have lost them, then you will only get into the safe if your Keyholder permits it. If all the keys to your chastity device are also in the safe and you need to get out, then unless you get the code to the safe from the Keyholder, you will have to cut off the device (if you can!) If you have played around with the KeySafe and KeyCodes using test mode as suggested above, you have some idea just how real the power exchange with a Keyholder could be.

2. Therefore, you need to be realistic about the risks and not let your hormones get you into a situation you might regret. It is a fact that some Keyholders visit the site for a bit and then disappear forever. It is also sadly true that some Keyholders don't really care about their wearers and will keep your keys no matter what you do just because they enjoy the power.

For these reasons, the KeySafe site now has TWO features to help you limit (not eliminate) these risks. There is now a page titled “Takeback.” Once a Holder accepts your keys, you have 6 days spread across the first month on which you can use the Takeback page to get your keys (and control of your safe) returned. These opportunities to withdraw your keys occur on the 7th, 14th, 21st, and 28th, 29th, and 30th days after your keys are accepted. Think of this as a trial period during which both of you get to try out the keyholding relationship and see if the fit works. The days you can withdraw your keys have been spread out so that both of you can get a taste of what it is like for the Holder to truly control your chastity and you can NOT get out whenever you want.

However, you should note that your history file would show that you withdrew the keys (which holders will not like to see) so you should make every effort to work out any issues with the Holder before withdrawing your keys. Also, if a Holder does not log on to the site at least once every 30 days, you will have the option to have your keys returned. This is not automatic; you must actively withdraw the keys. For example, if you and your Holder have taken control off-line or she has been unavailable but everything is going smoothly you would just ignore the option.

3. Of course, after the trial period you really are at the mercy of your Keyholder. You can still protect yourself AND have a real transfer of

control to a Keyholder if you are willing to make a little effort. Before offering your keys, you could tape an extra copy of the key to your chastity device (and every lock I know gives you at least 2 copies of a key) to a dated page from a newspaper and then either laminate the key and paper using a cheap self laminate sheet available at any office supply store, OR lock it away in one of the transparent plastic lock boxes that can only be opened by breaking it. Either way, if you send your Keyholder a picture of the now secured key, she/he will be able to easily check if you have used the key but you will have a way out in an emergency.

If you want an even greater transfer of control, you can put all the keys to your chastity device in the KeySafe and put one of the two manual keys to the safe inside the safe and then laminate or plastic lockbox the other manual key as above. Now the only way to get the chastity off is to break open the manual key to the safe (which the Keyholder will discover) or for him/her to give you the KeyCode. Other variations on this theme are of course possible. It depends on what works for you and your Keyholder.

4. You should always negotiate with your Keyholder as much as possible before really locking those keys away. If you have absolutely no experience with the Keyholder at all, you may want to leave the safe door open (and let them know the keys are not yet locked away) until you are satisfied with the fit, even if this takes longer than the trial period. If it looks like you two have quite different visions of chastity and it is past the trial period, you should ask that your key be returned. The responsible Keyholder will quickly return the key. If the Keyholder is not responsible, at least you aren't helplessly locked up!
5. It makes sense to do a few trial unlocks with your Keyholder using the KeySafe site before really getting started with serious keyholding. The Keyholder has a lot of possibilities available on her Keys page and unlike you; she doesn't have a test mode. In all likelihood, this is all new to her and doing a couple of run throughs so she can see how things work and how they look on both her Keys screen and your history file will make it much more likely that the KeySafe will be used creatively and increase the enjoyment for both of you.
6. Of course, you can use the KeySafe as a complete fantasy tool and only pretend to put your keys into the safe or only pretend to put on your chastity device. However, the more real you make the power exchange

using the KeySafe, the more dependent you will be on your Keyholder. You may get very submissive or you may get very desperate, but in any case, you should treat your Keyholder with great respect and not go outside the bounds that you have negotiated.

The longer a chastity relationship continues, the more important the Keyholder becomes to the wearer. There can be a temptation to ask for more attention or reassurance and you should be careful not to be a pest. Communicate with your Keyholder if the loss of control is getting to be too psychologically (or physically) intense. Unless your Keyholder is in chastity themselves, they probably have no idea how intense every minute in chastity can be. They can tune out their keyholding whenever they want; you are a wearer 24/7 and can't escape from it whenever you want. Don't get angry with your Keyholder if they don't seem to get what you are going through, they probably don't! Instead, take any opportunities you are given to clearly communicate what you are going through to your Keyholder. It will make for a better experience for you both.

7. Finally, keep in mind that the KeySafe site makes it very easy for a Keyholder to practice a LOT of tease and denial. While your Keyholder can always give you the next code via e-mail or via a message, you will probably find most permissions coming via the site. Therefore, every day (or at whatever frequency your Keyholder suggests) you should check your Keys page to see if you have received either a permission or any instructions from your Keyholder.

You should be aware that while your Keyholder can just flat out grant you a permission, he/she could also set a permission time window of short or long duration that can begin any time of the day or night. If you miss one of these windows, you will be informed that you missed a window so you will know that you had a chance at release and missed it. If you do find the window, you will see a notification that you have a permission and then you would go to the Unlock/Checkin page to find the KeyCode to unlock your KeySafe. A sadistic Keyholder can give you lots of little windows that you are likely to miss before granting a real chance at release. Be aware of this tormenting side to the KeySafe.

8. **Advanced wearers only** – *After* you have established a good long-term KeySafe based chastity relationship and know you and your Keyholder work together well, you could consider increasing his/her control that one

final notch. A few wearers in long-term relationships and very secure chastity devices have (with the full knowledge of their holders) placed ALL the keys – including both manual keys – into the safe and completely locked it. The only way into the safe in the case of a true emergency where the keyholder cannot be reached is to destroy the safe. While this is not easy, it can be done and the cost of replacing the safe is much less than replacing a good chastity device.

This is a very serious and hard-core step and is definitely NOT for most KeySafe users. However, some couples who are serious about chastity have really done it, which illustrates that you and your Keyholder can use the Keysafe to make your loss of control as complete as you both want.

Using a non-recommended locking device as the Model 50

While we strongly recommend using an electronic 8-digit combination safe in conjunction with the Keysafe site, *any* kind of safe or lock using a combination of 8 digits or less can be used with the site. You could even use a simple manual 3-digit padlock with the site.

All you have to do is to use as many digits in the KeyCode as needed by your lock/safe. For example, if you have a 4-digit padlock and the KeyCode was 85749384, you would use only 8574 to set the combination for your lock. You can ignore the rest of the digits. In all other respects, the site will work for you just as if you had an electronic 8-digit combination safe.

Conclusion

Hopefully, these suggestions will help make your KeySafe experience safer, more real, more satisfying and just plain more fun than it would be otherwise. You have activated a great tool for exploring real chastity. Please let us know if you have any problems with the site.
